Promoting biking and changing behaviours of commuting

Biking to work should be associated with a premium feel, instead of being hidden away and pushed to the outskirts or cellar of the facilities. Supporting this mode of travel should also be done by improving infrastructure, services and commuter support. All this should have a health, sustainability and premium focus, making biking the preferred mode of transport.

Sustainable and healthy transportation and commuting should be supported and assisted, which is why we wish to build premium facilities for this kind of travels. There is a growing interest of biking to work, but facilities have previously not been built around this. We are aiming to change this at the Co-Valley project in Mölndal, a joint venture by NextStep and Vectura together with Mölndal city and AstraZeneca. We want to make a change and take our bike facilities and support service to the next level.

For this we wish to collaborate with you around solutions to improved bike storage, service and commuter support.

You will be given the opportunity to both identify needs, design solution and be part of implementing it into the designs of our facilities, which we start building during late 2019. This means supervision and contact with our team of project leaders and architects. You will be required to present the solutions to us in the end, through an oral and written report.

The solution should consider questions like how to assist biking through:

- Bike storage
- Bike service
- Bike commuter support and service
